- * Structured Data is any application that has a database that holds data as part of its standard operation. By contrast, Unstructured Data may be documents, graphics, images, videos, etc. that are not organized in a database structure that can be queried and reported from for content. This inventory should not consider applications such as Operating Systems, Productivity Suites, or Web Browsers, but, rather, focus on applications that create, modify, and gather data that may be used for Business Intelligence, Reporting, Balanced Scorecard, Event Correlation, and Analytics.
- ** Type is a set of broad categories of application and each application may have more than one category applied (e.g. – an application like Maximo could be used for Asset, Day-to-Day Operational and GIS data).
